Hello Gina,

Yes, I noted no difference between treatments for flowering and both treatments flowered mid-June to end of June (June 11 to 23 =75% flowered).

We did see a yield penalty from defoliation this year - no yield penalty from increased planting density.

Best regards,

Alexa

Subject: RE: 2024/2025 rye management meta-data questions

Dear Gina,

Souns good!

Sorry I didn't reply earlier. Just came back from holiday.

In red is my answer:

1. Do you know what depth your rye was planted at?

1.5/2cm depth

2. Was the seed treated with a fungicide before it was planted? If so do you know what it was treated with?

Due to establishment failure, we got the seed from you. I know was treated, but

don't know with what fungicide.

3. What date did you plant the rye? I know you had to replant it – I think the second replanting is the important one.

15.11.2025

4. Were some of the treatments harvested for biomass?

Treatment nr 18 it is defoliated. Date: 09.05.2025

5. Do you have a rough idea of when 50% of the rye was flowering? Did the biomass harvest impact that at all?

I can't really answer to this question, maybe @Alexa Nicole Peterson took some notes, or drone images.

But one thing for sure, it did not influence the harvesting time. We harvested for grain both treatments at the same time.

6. What date was the grain harvested?

20.08.2025

7. Did the row widths differ between the 300 pl m⁻² and 100 pl m⁻² treatments?

Row distance is the same in all plots and subplots. 24 cm

I hope the information will be useful.

Best regards,
Casandra

Subject: 2024/2025 rye management meta-data questions

Hi Casandra,

I'm finally integrating your data into mine to make a uniform dataset to hold the ergot information (samples are still being processed...). I have a couple quick questions:

1. Do you know what depth your rye was planted at?
2. Was the seed treated with a fungicide before it was planted? If so do you know what it was treated with?
3. What date did you plant the rye? I know you had to replant it – I think the second replanting is the important one.
4. Were some of the treatments harvested for biomass?
5. Do you have a rough idea of when 50% of the rye was flowering? Did the biomass harvest impact that at all?
6. What date was the grain harvested?
7. Did the row widths differ between the 300 pl m⁻² and 100 pl m⁻² treatments?

That's all I have for now, answer as you have time, no rush
